

# QiSpace<sup>™</sup> for Embedded Application Security

### The Quantum Threat to IoT

Advancements in Quantum Computing are accelerating, making the prospect of its breaking classical cryptography more real with every passing day. At the same time, many critical components of today's digital societies and economies rely on IoT and connected devices. With over 11 million new IoT devices coming online daily, and their functions becoming ever more mission-critical, it is important to ensure data and communications are quantum-secure between IoT device and cloud. Quantropi's QiSpace<sup>®</sup> TLS-Q for IoT provides connected platforms and devices with all three "**TrUE**" cryptographic components – **Tr**ust, **U**ncertainty, and **E**ntropy – required for complete quantum security.

#### **Implementing Strong Application Level Security**

QiSpace<sup>™</sup> offers a software development kit for major embedded platforms that provides product managers and developers with a complete suite of cryptographic functions to protect data, devices and systems, now and forever.

When you begin your quantum security transition today by using QiSpace<sup>™</sup> Quantum Entropy Services to provide quantum entropy (true random numbers) to your device endpoints, you will immediately achieve the full security potential of your current cryptographic functions. Then seamlessly integrate quantum-secure signing capabilities, critical data elements verification capabilities, and application level data encryption capabilities, optimized for high performance in resource constrained environments. Quantropi's QiSpace<sup>™</sup> Quantum Security Platform

Cryptographic Function	Quantum Security Platform	Quantum-Secure Use Cases	Applications
Asymmetric Encryption	CiSpace MASQ <sup>®</sup>	• Key Exchange Mechanism • Digital Signature & Authentication	• Aerospace • Automotive
Symmetric Encryption	QEEP"	• Data & Network Encryption • Block & Streaming Cipher	• Consumer • Defense • Industrial
Strong Random Numbers		• Streaming Entropy	• Infrastructure • Medical
Digit Size (Bytes)		Quantum Random Number Generation	• Telecom

# **Real-World Performance Highlights**

## **DS – Sign Verify Stats**

Quantiop Bringiton.

**Public Key & Digital Signature Size** 

#### Sign & Verify Time

MPPK-DS offers small digital signature sizes of 160B and high performance on both sign and verify operations.

## AES – Stats vs. QEEP

# **Real-World Performance Highlights**

ountrop Bringiton.

<b>⊘ MASQ</b> <sup>™</sup>	<ul> <li>Crypto-agile asymmetric encryption with support for NIST PQC finalists</li> <li>Available Quantropi novel PQC with significantly smaller signature sizes and better performance compared to current PQC finalists</li> </ul>
<b>QEEP</b> <sup>™</sup>	<ul> <li>Quantum-secure symmetric encryption on any IP network or device</li> <li>Up to 18x faster than software AES-256</li> <li>Dynamic code footprint as small as 10KB</li> </ul>
<b>© SEQUR</b> <sup>™</sup>	<ul> <li>NGen – Efficient and high-performance local pseudo-quantum random number generation</li> <li>QEaaS – Quantum-secure entropy distribution over the Internet leveraging high-performance FIPS-certified QRNGs</li> </ul>

# **Demonstration Overview**

	<ul> <li>Test #1: Asymmetric Key Exchange Mechanism</li> </ul>			
	<ul> <li>Demonstrate generation of (10) unique Post-quantum Public-Private Key pairs that would be used to share a session key between a device and an external party (ex. cloud or host service, other device, etc.) as part of initiation of typical secure communications session (ex. TLS).</li> </ul>			
	<ul> <li>Test each Key Pair by encrypting and decrypting a session key. Report test Pass / Fail.</li> </ul>			
	<ul> <li>Test #2: Digital Signature</li> </ul>			
	<ul> <li>Demonstrate generation of (10) unique Post-quantum Digital Signatures that would be used to authenticate identity with external party (ex. cloud or host service, other device, etc.) as part of initiation of typical secure communications session (ex. TLS). Also used for data and code signing.</li> </ul>			
	<ul> <li>Test each Digital Signature by signing and verifying a test string. Report test Pass / Fail.</li> </ul>			
<b>OEEP</b> <sup>™</sup>	Test #3: Symmetric Encryption			
	<ul> <li>Demonstrate generation of a NIST Level V Security "Quantum Permutation Pad" that would be used to symmetrically encrypt and decrypt messages based on 256-bit cryptographic key.</li> </ul>			
	<ul> <li>Test Symmetric Encryption by encrypting and decrypting (10) unique test strings.</li> <li>Report test Pass / Fail.</li> </ul>			
<b>© SEQUR</b> <sup>™</sup>	<ul> <li>Test #4: NGen - Quantum Random Number Generation</li> </ul>			
	<ul> <li>Demonstrate generation of (10) 256-bit random numbers suitable for use as strong cryptographic keys. Report Numbers.</li> </ul>			
	<ul> <li>Test #5: QEaaS - Quantum Entropy as a Service (local)</li> </ul>			
	<ul> <li>Demonstrate ability to receive quantum-encrypted block of entropy and decrypt locally. In local / offline demo mode, test decryption of pre-shared encrypted file. Report test Pass / Fail.</li> </ul>
